

Observations at Coats Marsh Gabriola Island, British Columbia

—species checklists

Before using these checklists, make sure you have the most recent posted versions. The online file is: <http://www.nickdoe.ca/pdfs/Webp679.pdf>

For the purposes of these lists, “Coats Marsh” includes ecologically integrated lands outside of the present official boundary of the RP (regional park). Specifically wetlands and trails on private land to the east of the RP, which is the lake’s eastern shore and also the catchment area of the lake; the 707 CP (community park) section of the Marsh Trail; and the southwestern corner of the 707 CP’s Canary Grass Meadow, which is the catchment area of the Stump Farm Streams.

Visits were not confined to trails or accessible clearings.

These checklists are not intended to be inventories because:

- (a) I am not a trained or even an expert amateur biologist
- (b) I did not go on searches for species that might be, or even probably are, present
- (c) it wasn’t the main purpose of most visits to compile species inventories.

Having said that, I did take many photographs, and I received expert advice on flowering plant identification from Phyllis Fafard. Gabriola checklists I used were by Keith Poulton (birds), Jane James and Phyllis Fafard ([plants](#)), and Phyllis Fafard ([woody plants](#)). Also used were the electronic atlases E-flora BC and E-fauna BC. Photographs are available in the series of field notes:

There are many more non-published photographs available on request.

Abundances are the results of personal observations. For example, “rare” may just mean I have only seen one, or at most two, examples of the species myself. It does not preclude the possibility that a timely search by a more experienced observer might reveal many more.

I did not attempt to capture butterflies, moths, or other insects, so many of those species remain unidentified. I also did not pick mushrooms, though many had been sufficiently damaged by deer or passers-by that I could see beneath the caps and observe the colour of any bruising.

In general, I did not attempt a technical examination of specimens that are unlikely to be reliably identified without one, or that are very unlikely to be unique to the marsh.

The version numbers are given a major increment each time one or more new species is added or deleted. Any other modification, a change of observational status for example, results in only a minor increment.

Abundance. For some species, a “when in season” proviso applies.

- A abundant
- AL locally abundant, may be rare or absent elsewhere
- C common
- CL locally common, may be rare or absent elsewhere
- F frequent
- FL locally frequent, may be rare or absent elsewhere
- O occasional
- OL locally occasional, absent elsewhere
- R rare

Habitat. For some species, several may apply though only the most significant is listed.

- AQ aquatic, in or on the lake
- BD buildings
- CT clearings and trails
- FD Douglas-fir (dry) forest
- FO open mixed forest
- FU forest understory
- FW alder (wet) forest
- LK over and around the lake
- OV overflights
- RP riparian and dry-season intermittent creeks and wetlands

Observational status. Observations are mostly visual only, but abundance of flickers, red-winged blackbirds, towhees, and tree frogs has occasionally been assessed by call or song as their voices are unmistakable. No species has been listed that has not been seen.

- A1 fully confident personal sighting with either more than 3 occurrences, or with good photographic evidence, or with familiarity with the species
- A2 very confident sighting but with less than 3 occurrences, and no good photographic evidence, and an unfamiliar species
- B1 same as A1 except that there is a less likely or very similar species that is hard to distinguish from the most probable species
- B2 same as A2 except that there is a less likely or very similar species that is hard to distinguish from the most probable species
- B3 moderately good sightings of what is most probably a hybrid
- C1 multiple other species that it might be although less likely, making only genus fairly reliable
- C2 several look-alikes, not even genus reliable
- C3 speculative identification, sighting poor and/or examination insufficiently technical
- D1 not observed personally, but reported by a very reliable source
- D2 not observed personally, but reported by a reasonably reliable but not professional source
- E1 not observed personally, but reported in the Coats Marsh RP Management Plan
- E2 not observed personally and reported only in the 707 CP Management Plan
- E3 not observed personally, reported in the Coats Marsh RP or 707 CP Management Plans but not in any other species checklist for Gabriola that I am aware of.
